Welcome to MkDocs

For full documentation visit mkdocs.org.

Commands

- `mkdocs new [dir-name]` - Create a new project.
- `mkdocs serve` - Start the live-reloading docs server.
- `mkdocs build` - Build the documentation site.
- `mkdocs -h` - Print help message and exit.

Project layout

```
mkdocs.yml    # The configuration file.
docs/
    index.md  # The documentation homepage.
    ...       # Other markdown pages, images and other files.
```

Configuration

The `mkdocs.yml` file contains all the configuration for your documentation project.

```
1   site_name: My Docs
2   nav:
3       - Home: index.md
4       - User Guide: user-guide.md
5       - About: about.md
```

The `site_name` variable sets the name of your documentation project. The `nav` variable defines the structure of your site and the order in which the pages are displayed. Each item in the `nav` list is a link to a markdown file. The key is the name of the link and the value is the path to the markdown file relative to the `docs` directory.

Writing your docs

MkDocs uses Markdown for writing your documentation. Markdown is a lightweight markup language that you can use to add formatting elements to your text. You can use it to add headings, paragraphs, lists, links, images, code blocks, and more.
